How to Implement Next.js with Electron Using React Server Components

Tim Neutkens

Jan 6, 2022 · 10 min read

With the emergence of **React Server Components**, a new way of building apps has been released to the public over the weekend. This is a completely rewritten stack, a Next.js Canary version, that supports React Server Components, Suspense, Streaming SSR, Server Actions, and more. Example (yet other RSC frameworks, or a custom implementation, are also possible).

At the same time, Electron is a file-based, cross-platform application framework for building cross-platform apps, using web technologies, especially when the application requires integration with the operating system. Electron is used by many companies, including Slack, Microsoft, Twitch, Vercel, Netflix, Facebook, Twitter, Discord, Shopify, Pinterest, Figma, Notion, Skype, Trello, Zoom, Mailchimp, Cloudflare, Dropbox, Google, Microsoft, Slack
